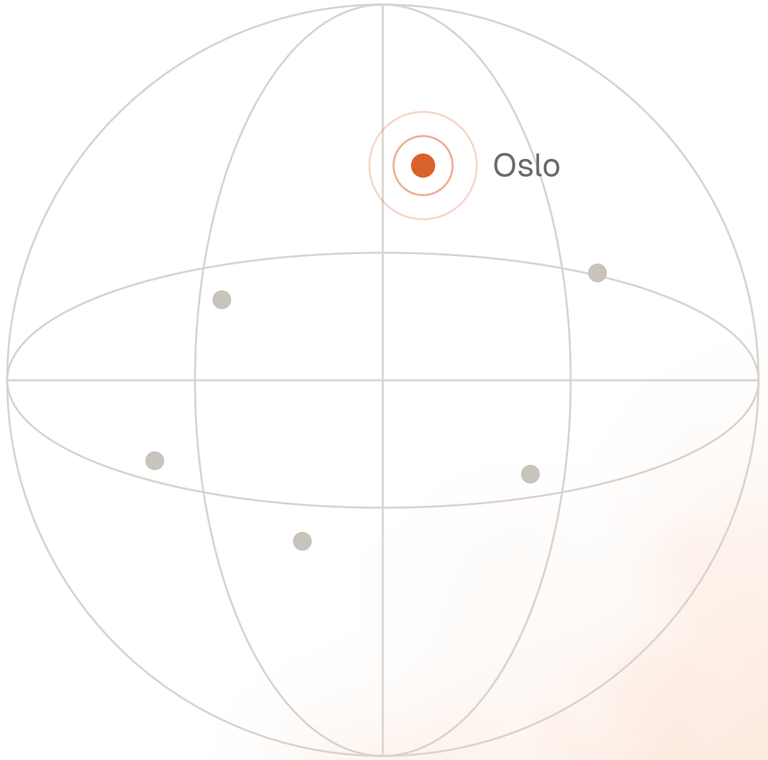
Pulse

Know the rush before it hits.

Oslo Sprint 2026

Not only for Oslo. For everywhere.

- Built and tested on one real Burger King in Oslo, at Klingenberggata 5.
- Any store with an address can get the same local picture.



PROBLEM

Busy stores plan blind.

While travelling in Oslo, I met my old Domino's employer. He now owns a very busy Burger King near Aker Brygge.

His real problem is planning ahead around what happens near the store: trains that stop, events, weather, and why one day went well.

I lived it too. At Domino's there was no forecast. When a rush hit, I was called in at short notice to help for a few hours.

It is a personal problem, not a guess.

SOLUTION

Pulse watches the area for you.

- Real-time data for one local store.
- Events nearby.
- Transport and disruptions.
- Weather, and more.
- An hourly forecast of orders, the crew it needs, and why.

MARKET

Start where the margin is thin.

- High-traffic, high-demand fast food stores.
- More than 20 employees.
- Thin margins, and staff is the biggest cost they control.
- They need this local picture every day.

FOUNDER

Why me

- Ran e-commerce while living in Norway and made 15k USD selling products.
- Coding since I was 10. Built an ERP for Etsy sellers that grew to daily power users, paying users and 10k ARR today.
- Full time on an inventory management startup with a co-founder who has owned jewellery stores and supermarkets.
- Studying computational engineering and AI in Finland.

COMPETITORS

Others are not hyper-local.

OTHERS

- Depend heavily on manual input from the store.
- Use a few broad area variables, not many local ones.

PULSE

- Reads many local signals around one address.
- Does it automatically.

Demo

- Live, on the real store.

Thank you
